### Exercise 2.1.5 Two LEDs on one digital output

For a circuit, you need to control two LEDs, but unfortunately, only one digital output is free. The supply voltage of the microcontroller and the board is  $5\text{ V}$ . LED1 should have a forward voltage  $U_{f,1}=2.3\text{ V}$  (red), LED2 should have a forward voltage  $U_{f,2}=2.1\text{ V}$  (green).

1. Design a circuit from the existing voltage levels so that both LEDs can be driven.

Existing voltage levels:

1. Supply:  $5\text{ V}$
  2. Digital output:  $5\text{ V}$ ,  $0\text{ V}$  or high impedance
1. Calculate the values for the other necessary components
