Exercise E1 Resistivity and temperature dependent Resistance (written test, approx. 7 % of a 60-minute written test, SS2023) 2

resistivity, power, exam ee1 SS2023

**Exercise E1 Resistivity and temperature dependent Resistance
(written test, approx. 7 % of a 60-minute written test, SS2023)**

The conductivity of a dielectric material is given by the Arrhenius law, which is described by the equation $\rho(T) = \rho_0 \exp(\frac{E_a}{kT})$. The activation energy E_a is 0.8 eV. The resistivity of the dielectric material is $\rho(20 \text{ }^\circ\text{C}) = 10^{17} \text{ } \Omega \cdot \text{m}$. Calculate the resistance for the dielectric material for $20 \text{ }^\circ\text{C}$ and $55 \text{ }^\circ\text{C}$. The thickness of the dielectric material is $d = 100 \text{ } \mu\text{m}$.

Solution
 The resistivity of the dielectric material is $\rho(20 \text{ }^\circ\text{C}) = 10^{17} \text{ } \Omega \cdot \text{m}$.
 For the given material the temperature coefficients in the range of $20 \text{ }^\circ\text{C}$ and $55 \text{ }^\circ\text{C}$ are given as $\alpha = -0.048 \text{ } 1/\text{K}$ and $\beta = +0.00057 \text{ } 1/\text{K}^2$.

$$R(55 \text{ }^\circ\text{C}) = R(20 \text{ }^\circ\text{C}) \cdot (1 + \alpha \cdot \Delta T + \beta \cdot T^2 + \dots)$$

$$= 80 \text{ } \text{G}\Omega \cdot (1 - 0.048 \text{ } 1/\text{K} \cdot (35 \text{ } \text{K}) + 0.00057 \text{ } 1/\text{K}^2 \cdot \Delta T^2)$$

Calculate the resistance for the dielectric material for $20 \text{ }^\circ\text{C}$.

Solution

```
\begin{align*} R(20 \sim \text{°C}) &= \rho \cdot \left\{ \frac{d}{A} \right\} \cdot 10^{17} \sim \Omega \\ \text{m} \cdot \left\{ \frac{0.8 \cdot 10^{-6} \sim \text{m}}{1 \sim \text{m}^2} \right\} \end{align*}
```
