Exercise E3 Impedances at different Frequencies (written test, approx. 18 % of a 60-minute written test, WS2022) 2

complex impedance, exam ee1 WS2022

Exercise E3 Impedances at different Frequencies (written test, approx. 18 % of a 60-minute written test, WS2022)

Exercise E3: A series circuit consists of a resistor R1 = 1.00 Ω, an inductor L = 4.7 μH, and a capacitor C = 40 nF. The voltage across the resistor is 10.0 V. Calculate the magnitude of the impedance of the capacitor at f = 4 MHz.

Solution

$R_1 = 1.00 \Omega$

$R_2 = 10.0 \Omega$

A series circuit means that the current is constant on every component.

The equivalent impedance for R and L combined is given by $Z = R + j\omega L$

Parallel circuit means that the voltage is the same on R2 and C2

$Z_{parallel} = \frac{R_2 \cdot X_C}{R_2 + X_C}$

Since X_C is perpendicular to R_2 , this can be simplified to $Z_{parallel} = \frac{R_2 \cdot X_C}{\sqrt{R_2^2 + X_C^2}}$

X_C is perpendicular to $Z_{parallel}$ (It has to, since R_2 is perpendicular to X_C)

Therefore, the resulting current of the parallel circuit is given as:

$I_{parallel} = \frac{U}{Z_{parallel}} = \frac{U \cdot \sqrt{R_2^2 + X_C^2}}{R_2 \cdot X_C}$

This can be rearranged to $I_{parallel} = \frac{U \cdot \sqrt{R_2^2 + X_C^2}}{R_2 \cdot X_C}$

$I_{parallel} = \frac{10 \text{ V} \cdot \sqrt{10^2 + X_C^2}}{10 \cdot X_C} = 1 \text{ A}$

Back to the first formula: $I_{parallel} \cdot Z_{parallel} = U$

$1 \text{ A} \cdot \frac{10 \cdot X_C}{\sqrt{10^2 + X_C^2}} = 10 \text{ V}$

$X_C = \sqrt{10^2 + X_C^2}$
