Exam Summer Semester 2023

Additional permitted Aids

- non-programmable calculator,
- formulary (2 DIN A4 pages)

Hits

- The duration of the exam is 60 min.
- Attempts to cheat will lead to exclusion and failure of the exam.
- Withdrawal is no longer possible after these exam has been handed out.
- Please write down intermediate calculations and results on the assignment sheet. (when more space is needed also on the reverse side. In this case: Mark it clearly).
- Always use units in the calculation.
- Use a document-proof, non-red pen.

Tasks

Exercise E1 Resistivity and temperature dependent Resistance (written test, approx. 7 % of a 60-minute written test, SS2023)

The resistivity ρ of a dielectric material is described by the Arrhenius law in an exponential form as $\rho = \rho_0 \cdot \exp(\alpha/T + \beta/T^2)$ for T between 20 °C and 100 °C.

The resistivity of the dielectric material is $\rho(20 \text{ °C}) = 10^{17} \text{ } \Omega \cdot \text{m}$.

For the given material the temperature coefficients in the range 20 °C and 55 °C are given as $\alpha = -0.048 \text{ } 1/\text{K}$ and $\beta = +0.00057 \text{ } 1/\text{K}^2$.

$$\begin{aligned} \rho(55 \text{ °C}) &= \rho(20 \text{ °C}) \cdot (1 + \alpha \cdot \Delta T + \beta \cdot T^2 + \dots) \\ &= 10^{17} \text{ } \Omega \cdot \text{m} \cdot (1 - 0.048 \text{ } 1/\text{K} \cdot (35 \text{ K}) + 0.00057 \text{ } 1/\text{K}^2 \cdot (35 \text{ K})^2) \end{aligned}$$

Calculate the resistance for the dielectric material for $20 \text{ }^\circ\text{C}$.

Solution

$$R(20 \text{ }^\circ\text{C}) = \rho \cdot \frac{d}{A} = 10^{17} \frac{\text{m} \cdot 0.8 \cdot 10^{-6}}{1 \text{ m}^2}$$

Exercise E1 Resistivity and temperature dependent Resistance (written test, approx. 7 % of a 60-minute written test, SS2023)

The conductivity of a dielectric material is given by $\rho = \rho_0 \cdot e^{-\frac{E_a}{kT}}$ with $\rho_0 = 10^{17} \text{ } \Omega \cdot \text{m}$ and $E_a = 0.8 \text{ eV}$. Calculate the resistance of a dielectric material with a thickness of $d = 0.8 \text{ } \mu\text{m}$ and a surface area of $A = 1 \text{ m}^2$ at $T = 25 \text{ }^\circ\text{C}$ and $T = 100 \text{ }^\circ\text{C}$.

Solution: The plates of $d = 0.5 \text{ mm}$ and $l = 10 \text{ mm}$ are separated by a dielectric material with $\epsilon_r = 10$ and $\rho = 10^{17} \text{ } \Omega \cdot \text{m}$.
 The resistivity of the dielectric material is $\rho = 10^{17} \text{ } \Omega \cdot \text{m}$.
 For the given material the temperature coefficients in the range of $20 \text{ } ^\circ\text{C}$ and $55 \text{ } ^\circ\text{C}$ are given as $\alpha = 4 \cdot 10^{-4} \text{ } \text{K}^{-1}$ and $\beta = 1 \cdot 10^{-6} \text{ } \text{K}^{-2}$.

$$R(T) = R(20 \text{ } ^\circ\text{C}) \cdot (1 + \alpha \cdot (T - 20) + \beta \cdot (T - 20)^2)$$

$$R(55 \text{ } ^\circ\text{C}) = R(20 \text{ } ^\circ\text{C}) \cdot (1 + 0.0004 \cdot (55 - 20) + 0.000001 \cdot (55 - 20)^2)$$

Calculate the resistance for the dielectric material for $20 \text{ } ^\circ\text{C}$.

Solution

$$R(20 \text{ } ^\circ\text{C}) = \rho \cdot \frac{l}{A} = 10^{17} \text{ } \Omega \cdot \text{m} \cdot \frac{0.5 \cdot 10^{-3} \text{ m}}{1 \cdot 10^{-2} \text{ m}^2}$$

Exercise E1 Analyzing a Scope Plot
 (written test, approx. 12 % of a 60-minute written test, SS2023)

Q. What is the phase shift of the signals for the inductor? (in radians and degree)?

Result: The measured current curve shall be visible as a dashed line.

The continuous line shows the voltage.

Solution

Use the correct symbols and units in your answers!

1. Calculate the frequency f of the periodic signals.

Solution

Frequency f is given by the period T . The period can be measured in the image of the scope.

1. The sine waves repeat after 6 divisions (e.g. from falling turning point to falling turning point of one curve)
2. The scale is 0.1 ms/Div

$$f = \frac{1}{T} \quad T = 6 \text{ Div} \cdot 0.1 \text{ ms/Div} \Rightarrow f = \frac{1}{6 \text{ Div} \cdot 0.1 \text{ ms/Div}}$$

Exercise E1 Complex voltage dividers
 (written test, approx. 16 % of a 60-minute written test, SS2023)

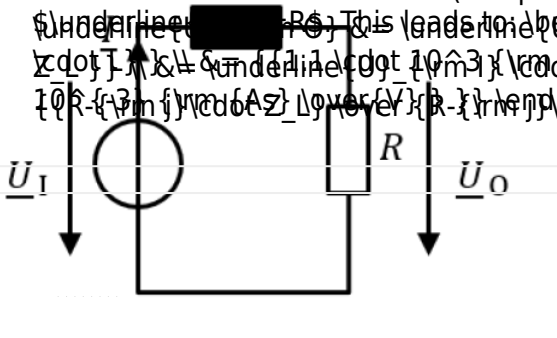

Calculate the two impedances in the following circuit and the resulting phase shift between the voltage \underline{U} and the current \underline{I} . Choose an appropriate scaling factor and write it down.

- $R = 1.1 \text{ } \Omega$

Solution $L = 3.5 \text{ mH}$

Result $\underline{U} = 0.5 \text{ V} \cdot e^{j(\omega t - \pi/4)}$

The cut-off frequency is the absolute value of the imaginary part of the impedance \underline{Z}_L is equal to $\omega L = 2\pi \cdot 150 \text{ kHz} \cdot 3.5 \text{ mH} = 3.3 \text{ } \Omega$. This leads to $\underline{Z}_L = 1.1 \text{ } \Omega + j3.3 \text{ } \Omega$.

.. Calculate the impedance \underline{Z}_L .

Solution

$$\underline{Z}_L = j \omega L = j \cdot 2\pi \cdot 150 \text{ kHz} \cdot 3.5 \text{ mH}$$

Exercise E1 Pure Resistor Network Simplification
 (written test, approx. 12 % of a 60-minute written test, SS2023)

Calculate the voltage U_K , when switch S is closed.

Result

The values in the circuit are

Solution

- $R_1 = 60 \text{ } \Omega$
- $R_2 = 40 \text{ } \Omega$
- $R_3 = 40 \text{ } \Omega$

The voltage divider for node K has the same proportionality as the voltage divider for node K' . Therefore, the potential of K is the same as for K' . There will be no current flow through R_3 . The resistance does not create a voltage drop and therefore does not interfere with the circuit.

1. Calculate the voltage at node K , when switch S is open. It might be beneficial to redraw the circuit first.

Solution

Rearranging the circuit one can get:

Once the switch S is opened, the upper part is a parallel circuit. Therefore, R_{eq} is given as:

$$R_{\text{eq}} = (R_1 + R_2) \parallel (R_1 + R_2) + R_4 = \frac{1}{2} \cdot (R_1 + R_2) + R_4 = \frac{1}{2} \cdot (60 \Omega + 40 \Omega) + 100 \Omega$$

Exercise E1 Pure Resistor Network Simplification I
(written test, approx. 14 % of a 60-minute written test, SS2023)

The circuit below should be given as $U_{\text{AB}} = 60 \text{ V}$. What is the value for I_{AB} the circuit?

Solution

$$I_{\text{AB}} = \frac{U_{\text{AB}}}{R_{\text{eq}}} = \frac{60 \text{ V}}{100 \Omega}$$

The current through the circuit is given as $I_{\text{AB}} = \frac{U_{\text{AB}}}{R_{\text{eq}}}$.

This current has to flow in summary through parallel branches. The voltage U in question in the upper right branch given by $(4R \parallel 4R) + 2R + 2R$. Its resistance is just the same as the upper left branch $6R$.

Therefore, half of the current flows to the left half to the right side.

The voltage U is consequently:
$$U = \frac{I_{\text{arm AB}}}{2 \cdot R_{\text{eq}}} \quad \parallel \quad U = \frac{U_{\text{AB}} \cdot 2R}{2 \cdot R_{\text{eq}}} \quad \parallel \quad U = \frac{60 \text{ V}}{5}$$

1. What is the equivalent resistance R_{eq} ?

Solution

Part of the circuit is shorted. Here the resistors (marked in red) are shorted by the connections marked in blue:

The circuit can then be rearranged for better interpretation:

Therefore, R_{eq} is given as:
$$R_{\text{eq}} = (2R || 2R + R +$$

$$R_1 || 6R + 6R || (2R + 2R + 4R || 4R) || (R + R + R) || 6R + 6R || (2R + 2R + 2R) || \\ \&= 3R || 6R + 6R || 6R || \&= \frac{3R \cdot 6R}{3R + 6R} + 3R \end{align*}$$

Exercise E2 Equivalent Linear Source (written test, approx. 10 % of a 60-minute written test, SS2023)

The circuit below has to be simplified. Use equivalent linear sources for simplification.
 Calculate the internal resistance R_{i} and the source voltage U_{s} of an equivalent linear voltage source.

- $R_1 = 5 \text{ } \Omega$
 - $U_1 = 10 \text{ V}$
 - $R_2 = 5 \text{ } \Omega$
 - $I_3 = 0.5 \text{ A}$
 - $R_4 = 10 \text{ } \Omega$
 - $U_5 = 4 \text{ V}$
- Result: $U_{\text{AB}} = 1.11 \text{ V}$, $R_{\text{i}} = 5.55 \text{ } \Omega$

Solution

The principle idea here is to find parts of the circuit which are already a linear (voltage or current) source. Then this can be transformed into the equivalent other source, as shown in the next picture.

In order to get the currents one has to calculate it by $I_x = \frac{U_x}{R_x}$

$$\begin{aligned} I_0 &= \frac{U_0}{R_1} = \frac{10 \text{ V}}{5 \text{ } \Omega} = 2 \text{ A} \\ I_5 &= \frac{U_5}{R_4} = \frac{4 \text{ V}}{10 \text{ } \Omega} = 0.4 \text{ A} \end{aligned}$$

I_3 and I_0 can be combined to $I_{03} = I_0 - I_3$ facing upwards:
$$I_{03} = 1.5 \text{ A}$$

Then, the linear current source I_{03} with R_1 gets transformed into a linear voltage source with $U_{03} = R_1 \cdot I_{03}$ facing down.
$$U_{03} = 7.5 \text{ V}$$

Then, the resistors R_1 and R_2 can be combined to $R_{12} = R_1 + R_2$.

After this, the next step is to make a linear current source out of U_{03} and R_{12} . The current will be $I_{0123} = \frac{U_{03}}{R_{12}}$, facing up again.
$$I_{0123} = 0.6 \text{ A}$$

The second-last step is the sum up of the current sources I_{0123} and I_5 as $I_{01235} = I_{0123} - I_5$ and the resistors as $R_{124} = R_{12} || R_4$.
$$I_{01235} = 0.2 \text{ A} \quad R_{124} = 5.55 \text{ } \Omega$$

The final step is the back-transformation to a linear voltage source, with $U_{\text{AB}} = R_{124} \cdot I_{01235}$.

The simplest and fastest (= for exams) is to work with interim results in the calculation.

Here, there there is also a full final formula given:

$$U_{\text{AB}} = U_{\text{AB}} = I_{01235} \cdot R_{124} = (I_{0123} - I_5) \cdot (R_{12} \parallel R_4) = \left(\frac{U_3}{R_{12}} - I_5 \right) \cdot (R_{12} \parallel R_4) = \left(\frac{R_1 \cdot I_3}{R_1 + R_2} - I_5 \right) \cdot (R_{12} \parallel R_4) = \frac{R_1 \cdot \left(\frac{U_0}{R_1} - I_3 \right)}{R_1 + R_2} - I_5 \cdot (R_{12} \parallel R_4)$$

Exercise E1 (Dis)Charging Capacities (written test, approx. 14 % of a 60-minute written test, SS2023)

The circuit below consists of a current source $I_0 = 0.6 \text{ mA}$, a voltage source $U_0 = 10 \text{ V}$, a capacitor $C = 200 \text{ nF}$, and resistors $R_1 = 8 \text{ k}\Omega$, $R_2 = 17 \text{ k}\Omega$, $R_3 = 36 \text{ m}\Omega$, and $R_4 = 50 \text{ m}\Omega$. At $t = 0$, the switch S_1 switches to the situation shown in the drawing. What is the new time constant?

- $C = 200 \text{ nF}$

Solution: $R = 8.0 \text{ k}\Omega$
 Solution: $\tau = 8.0 \text{ k}\Omega \cdot 200 \text{ nF} = 1.6 \text{ ms}$
 Solution: $U_C = 25 \text{ V}$

$$U_C = U_0 \cdot \left(1 - e^{-\frac{t}{\tau}} \right) \Rightarrow 25 = 10 \cdot \left(1 - e^{-\frac{t}{1.6 \text{ ms}}} \right) \Rightarrow e^{-\frac{t}{1.6 \text{ ms}}} = \frac{1}{4} \Rightarrow \frac{t}{1.6 \text{ ms}} = \ln(4) \Rightarrow t = 1.6 \text{ ms} \cdot \ln(4) \approx 2.2 \text{ ms}$$

Again, the current of the source flows through the circuit consisting of C in parallel with R_1 and R_2 . Without the parallel resistors, the current source would charge the capacitor "to infinity" ($C \rightarrow \infty$). This is here limited by the parallel resistors R_1 and R_2 . Then, the source U_0 drives the current through the series circuit given by I_0 , C , R_1 and R_2 .

The maximum voltage on the branch with the resistors $(R_1 \parallel R_2) \cdot C = (8 \text{ k}\Omega + 17 \text{ k}\Omega) \cdot 0.2 \text{ }\mu\text{F} = 25 \cdot 10^{-3} \cdot 0.2 \text{ }\mu\text{F} = 5 \text{ V}$

$$U_C = U_0 \cdot \frac{R_1 \parallel R_2}{R_1 \parallel R_2 + C} = \frac{10 \text{ V} \cdot (R_1 \parallel R_2)}{R_1 \parallel R_2 + C}$$

This is also the maximum voltage on the capacitor, since it is in parallel with the resistors.

Before t_0 all switches are switched as shown and the capacitor is fully discharged. At $t_0 = 0 \text{ s}$ the switch S_1 shall switch to the voltage source.

1. Calculate the time constant for charging the capacitor.

Solution

The time constant is generally given as: $\tau = R \cdot C$

Once S_1 is closed and S_2 is open at t_0 , the source U drives the current through the series circuit given by S_1 , C , R_1 and R_3 .

Therefore, $R = R_1 + R_3$

$$\tau_1 = (R_1 + R_3) \cdot C = (8 \text{ k}\Omega + 7 \text{ k}\Omega) \cdot 0.2 \text{ }\mu\text{F} = 15 \cdot 10^3 \cdot 0.2 \cdot 10^{-6} \text{ s} = 3 \text{ ms}$$

...

Solution

Both courses of the voltage for charging and discharging are described with an exponential function. However, the curve for charging increases first steep and flattens out for longer time scales ($\propto (1 - e^{-x})$).

Exercise E1 Impedances at Frequencies
(written test, approx. 14 % of a 60-minute written test, SS2023)

At a high frequency with $C_2 \rightarrow \infty$ (short circuit), the voltage across C_1 is $U_{C1} = U \cdot \frac{R_1}{R_1 + R_2} = 10 \text{ V} \cdot \frac{10 \text{ }\Omega}{10 \text{ }\Omega + 10 \text{ }\Omega} = 5 \text{ V}$

Exercise E2 Analyzing a Scope Plot
 (written test, approx. 12 % of a 60-minute written test, SS2023)

What is the phase shift between the voltage and current (in radians and degree)?

The measured current curve shall be visible as a dashed line.

The continuous line shows the voltage.

Solution

```

\begin{align*} f &= 15 \text{ m kHz} \\ U_{\text{RMS}} &= 10.6 \text{ V} \\ I_{\text{RMS}} &= 0.3535 \text{ A} \\ \varphi &= -30^\circ \\ I_{\text{RMS}} &= 0.35 \text{ A} \end{align*}

```

The current is positive as the voltage is square wave. The difference between the two is that the voltage lags the current.

A full period has an angle of 360° or 2π in radian.

One period of the RMS voltage is 3.77 ms . To get the value of the phase shift, we divide the period of the current by the period of the voltage.

```

\begin{align*} \varphi &= -30^\circ \end{align*}

```

Use the correct symbols and units in your answers!

1. Calculate the frequency f of the periodic signals.

Solution

Frequency f is given by the period T . The period can be measured in the image of the scope.

1. The sine waves repeat after 6 Div (e.g. from falling turning point to falling turning point of one curve)
2. The scale is 0.1 ms/Div

$$\begin{aligned} f &= \frac{1}{T} \quad T = 6 \text{ Div} \cdot 0.1 \text{ ms/Div} \\ \rightarrow f &= \frac{1}{6 \text{ Div} \cdot 0.1 \text{ ms/Div}} \end{aligned}$$

Exercise E3 Complex voltage dividers
(written test, approx. 16 % of a 60-minute written test, SS2023)

1. Calculate the two impedances Z_1 and Z_2 by resulting phase shift for the total impedance $Z = 50 \text{ k}\Omega$. Choose an appropriate scaling factor and write it down.

- $R = 1.1 \text{ k}\Omega$

Solution $L = 3.5 \text{ mH}$

Results

$$\begin{aligned} \underline{U}_I &= 5 \text{ V} \\ \underline{U}_{Z_1} &= 50 \text{ k}\Omega \\ \underline{U}_O &= 0.5 \text{ V} - j \cdot 1.5 \text{ V} \end{aligned}$$

At cut off frequency the absolute values of impedances \underline{Z}_L is equal to the absolute value of R . This leads to the voltage divider $\frac{R}{R + j\omega L}$ and $\frac{U_O}{U_I} = \frac{R}{R + j\omega L}$. At $\omega = \frac{1}{RC}$ the absolute value of \underline{Z}_L is equal to the absolute value of R . This leads to the voltage divider $\frac{R}{R + j\omega L}$ and $\frac{U_O}{U_I} = \frac{R}{R + j\omega L}$.

.. Calculate the impedance \underline{Z}_L .

Solution

$$\underline{Z}_L = j\omega L = j \cdot 2\pi \cdot 150 \text{ kHz} \cdot 3.5 \text{ mH}$$

Exercise E1 Pure Resistor Network Simplification
 (written test, approx. 12 % of a 60-minute written test, SS2023)

Calculate the voltage U_K , when switch S is closed.

Result

The values in the circuit are

Solution

- $R_1 = 60 \Omega$
 - $R_2 = 40 \Omega$
 - $R_3 = 40 \Omega$
 - $R_4 = 10 \Omega$
- The voltage divider for U_K has the same proportionality as the voltage divider for $U_{K'}$. Therefore, the potential of U_K is the same as for $U_{K'}$. There will be no current flow through R_3 . The resistance does not create a voltage drop and therefore does not interfere with the circuit.

1. Calculate the voltage at node K , when switch S is open. It might be beneficial to redraw the circuit first.

Solution

Rearranging the circuit one can get:

Once the switch S is opened, the upper part is a parallel circuit. Therefore, R_{eq} is given as:

$$R_{\text{eq}} = (R_1 + R_2) \parallel (R_1 + R_2) + R_4 = \frac{1}{2} \cdot (R_1 + R_2) + R_4 = \frac{1}{2} \cdot (60 \Omega + 40 \Omega) + 100 \Omega$$

Exercise E2 Pure Resistor Network Simplification I
(written test, approx. 14 % of a 60-minute written test, SS2023)

The circuit below should be given as $U_{\text{AB}} = 60 \text{ V}$. What is the value for I_{AB} the circuit?

Solution

$$I_{\text{AB}} = \frac{U_{\text{AB}}}{R_{\text{eq}}} = \frac{60 \text{ V}}{100 \Omega} = 0.6 \text{ A}$$

The current through the circuit is given as $I_{\text{AB}} = \frac{U_{\text{AB}}}{R_{\text{eq}}}$.

This current has to flow in summary through parallel branches. The voltage U in question in the upper right branch given by $(4R \parallel 4R) + 2R + 2R$. Its resistance is just the same as the upper left branch $6R$.

Therefore, half of the current flows to the left half to the right side.

The voltage U is consequently:
$$U = \frac{I_{\text{arm AB}}}{2 \cdot R_{\text{eq}}} \quad \parallel \quad U = \frac{U_{\text{arm AB}} \cdot 2R}{2 \cdot R_{\text{eq}}} \quad \parallel \quad U = \frac{60 \text{ V}}{5}$$

1. What is the equivalent resistance R_{eq} ?

Solution

Part of the circuit is shorted. Here the resistors (marked in red) are shorted by the connections marked in blue:

The circuit can then be rearranged for better interpretation:

Therefore, R_{eq} is given as:
$$R_{\text{eq}} = (2R || 2R + R +$$

$$R_1 || 6R + 6R || (2R + 2R + 4R || 4R) || (R + R + R) || 6R + 6R || (2R + 2R + 2R) || 3R || 6R + 6R || 6R || \frac{3R \cdot 6R}{3R + 6R} + 3R$$

Exercise E1 Equivalent Linear Source
(written test, approx. 10 % of a 60-minute written test, SS2023)

The circuit below has to be simplified. Use equivalent linear sources for simplification.
 Calculate the internal resistance R_{i} and the source voltage U_{s} of an equivalent linear voltage source.

- $R_1 = 5 \text{ } \Omega$
- $U_1 = 10 \text{ V}$
- $R_2 = 5 \text{ } \Omega$
- $I_3 = 0.5 \text{ A}$
- $R_4 = 10 \text{ } \Omega$
- $U_5 = 4 \text{ V}$

Solution

The principle idea here is to find parts of the circuit which are already a linear (voltage or current) source. Then this can be transformed into the equivalent other source, as shown in the next picture.

In order to get the currents one has to calculate it by $I_x = \frac{U_x}{R_x}$

$$\begin{aligned} I_0 &= \frac{U_0}{R_1} = \frac{10 \text{ V}}{5 \Omega} = 2 \text{ A} \\ I_5 &= \frac{U_5}{R_4} = \frac{4 \text{ V}}{10 \Omega} = 0.4 \text{ A} \end{aligned}$$

I_3 and I_0 can be combined to $I_{03} = I_0 - I_3$ facing upwards:

$$I_{03} = 1.5 \text{ A}$$

Then, the linear current source I_{03} with R_1 gets transformed into a linear voltage source with $U_{03} = R_1 \cdot I_{03}$ facing down.

$$U_{03} = 7.5 \text{ V}$$

Then, the resistors R_1 and R_2 can be combined to $R_{12} = R_1 + R_2$.

After this, the next step is to make a linear current source out of U_{03} and R_{12} . The current will be $I_{0123} = \frac{U_{03}}{R_{12}}$, facing up again.

$$I_{0123} = 0.6 \text{ A}$$

The second-last step is the sum up of the current sources I_{0123} and I_5 as $I_{01235} = I_{0123} - I_5$ and the resistors as $R_{124} = R_{12} || R_4$.

$$I_{01235} = 0.2 \text{ A} \quad R_{124} = 5.55 \dots \Omega$$

The final step is the back-transformation to a linear voltage source, with $U_{\text{AB}} = R_{124} \cdot I_{01235}$.

The simplest and fastest (= for exams) is to work with interim results in the calculation.

Here, there there is also a full final formula given:

$$U_{\text{AB}} = U_{\text{AB}} = I_{01235} \cdot R_{124} = (I_{0123} - I_5) \cdot (R_{12} \parallel R_4) = \left(\frac{U_3}{R_{12}} - I_5 \right) \cdot (R_{12} \parallel R_4) = \left(\frac{R_1 \cdot I_3}{R_1 + R_2} - I_5 \right) \cdot (R_{12} \parallel R_4) = \frac{R_1 \cdot \left(\frac{U_0}{R_1} - I_3 \right)}{R_1 + R_2} - I_5 \cdot (R_{12} \parallel R_4)$$

Exercise E4 (Dis)Charging Capacities (written test, approx. 14 % of a 60-minute written test, SS2023)

The circuit below consists of a current source $I_0 = 0.6 \text{ mA}$, a voltage source $U_0 = 10 \text{ V}$, a capacitor $C = 200 \text{ nF}$, and resistors $R_1 = 8 \text{ k}\Omega$, $R_2 = 17 \text{ k}\Omega$, $R_3 = 10 \text{ k}\Omega$, and $R_4 = 50 \text{ k}\Omega$. The switch S_1 switches to the situation shown in the drawing. What is the new time constant?

- $C = 200 \text{ nF}$

Solution: $R = 8.0 \text{ k}\Omega$
 Solution: $\tau = 8.0 \text{ k}\Omega \cdot 200 \text{ nF} = 1.6 \text{ ms}$
 Solution: $U_C = 25 \text{ V}$

$$U_C = U_0 \cdot \left(1 - e^{-\frac{t}{\tau}} \right)$$

Again, the current of the source flows through the circuit consisting of C in parallel with R_1 and R_2 . Without the parallel resistors, the current source would charge the capacitor "to infinity" ($C \rightarrow \infty$). This is here limited by the parallel resistors R_1 and R_2 . Then, the source U_0 drives the current through the series circuit given by I_0 , C , R_1 and R_2 .

The maximum voltage on the branch with the resistors $(R_1 \parallel R_2) \cdot C = (8 \text{ k}\Omega + 17 \text{ k}\Omega) \cdot 0.2 \text{ }\mu\text{F} = 25 \cdot 10^{-3} \cdot 0.2 \text{ }\mu\text{F} = 5 \text{ V}$

$$U_C = U_0 \cdot \frac{R_1 \parallel R_2}{R_1 \parallel R_2 + C} = \frac{U_0 \cdot (R_1 \parallel R_2)}{R_1 \parallel R_2 + C}$$

This is also the maximum voltage on the capacitor, since it is in parallel with the resistors.

Before t_0 all switches are switched as shown and the capacitor is fully discharged. At $t_0 = 0 \text{ s}$ the switch S_1 shall switch to the voltage source.

1. Calculate the time constant for charging the capacitor.

Solution

The time constant is generally given as: $\tau = R \cdot C$

Once S_1 is closed and S_2 is open at t_0 , the source U drives the current through the series circuit given by S_1 , C , R_1 and R_3 .

Therefore, $R = R_1 + R_3$
 $\tau_1 = (R_1 + R_3) \cdot C = (8 \text{ k}\Omega + 7 \text{ k}\Omega) \cdot 0.2 \text{ }\mu\text{F} = 15 \cdot 10^3 \cdot 0.2 \cdot 10^{-6} \text{ s} = 3 \text{ ms}$

...

Solution

Both courses of the voltage for charging and discharging are described with an exponential function. However, the curve for charging increases first steep and flattens out for longer time scales ($1 - e^{-x}$).

Exercise E5 Impedances at Frequencies (written test, approx. 14 % of a 60-minute written test, SS2023)

At a high frequency with $C = 20 \text{ nF}$ (following the previous exercise) the value of the

Repeat the calculation with $\mu = 0.5$ and $L_1 = 15.9 \mu\text{H}$.

Solution

```

\begin{align*} f_0 &= 3000000.5 \text{ kHz} \\
\end{align*}

\begin{align*} X_{C2} &= X_C = \frac{1}{\omega C} = \frac{1}{2\pi \cdot 0.5 \cdot 10^6 \cdot 10^{-8}} = -20 \Omega \\
\end{align*}

```

Exercise E1 Efficiency

(written test, approx. 14 % of a 60-minute written test, SS2023)

2. (100%) A battery with an internal resistance of $R_i = 2 \Omega$ and an open-circuit voltage of $U_S = 3.5 \text{ V}$ is connected to a load resistor R_L . The battery shall provide energy for a device with an internal resistance of $R_D = 1 \Omega$ and an open-circuit voltage of $U_D = 1.0 \text{ V}$. The device shall be connected to the battery via a transformer with a turns ratio of $n = 0.5$. The transformer is ideal.

Result: The efficiency of the transformer is $\eta = 0.5$. The efficiency of the battery is $\eta_B = 0.5$. The overall efficiency is $\eta_{tot} = 0.25$. The load resistor R_L is 1Ω . The current through the load resistor is $I_L = 0.5 \text{ A}$. The current through the battery is $I_B = 1 \text{ A}$. The power delivered to the load resistor is $P_L = 0.5 \text{ W}$. The power delivered to the device is $P_D = 0.5 \text{ W}$. The power delivered to the transformer is $P_T = 0.5 \text{ W}$. The power delivered to the battery is $P_B = 0.5 \text{ W}$.

```

\begin{align*} U_S &= 3.5 \text{ V} \\
R_i &= 2 \Omega \\
U_D &= 1.0 \text{ V} \\
R_D &= 1 \Omega \\
n &= 0.5 \\
\end{align*}

\begin{align*} R_L &= 1 \Omega \\
\end{align*}

\begin{align*} \eta &= 0.5 \\
\eta_B &= 0.5 \\
\eta_{tot} &= 0.25 \\
I_L &= 0.5 \text{ A} \\
I_B &= 1 \text{ A} \\
P_L &= 0.5 \text{ W} \\
P_D &= 0.5 \text{ W} \\
P_T &= 0.5 \text{ W} \\
P_B &= 0.5 \text{ W} \\
\end{align*}
