### Exercise E4 Charges in Electroplating

To get a different metal coating onto a surface, often [Electroplating](#) is used. In this process, the surface is located in a liquid, which contains metal ions of the coating.

In the following, a copper coating (e.g. for corrosion resistance) shall be looked on. The charge of one copper ion is around  $1.6022 \cdot 10^{-19} \text{~}\{\text{r m C}\}$ , what is the charge on the surface if there are  $8 \cdot 10^{22} \text{~}\{\text{r m ions}\}$  added?

$\begin{align*} 12'818 \text{~}\{\text{r m C}\} \end{align*}$

Solution

$\begin{align*} 8 * 10^{22} \cdot 1.6022 * 10^{-19} \text{~}\{\text{r m C}\} = 12'817.6 \text{~}\{\text{r m C}\} \end{align*}$
