Exercise E5 Analyzing complex Impedances (written test, approx. 14 % of a 60-minute written test, WS2022)

2. Calculate the phasor voltage  $\underline{U}$  and the current  $\underline{I}$  in the circuit shown in the figure. The components ( $R$  and  $X_L$ ) shall be given.

After analysis, the full width dimensioned phasor voltage  $\underline{U}$  and the current  $\underline{I}$  in phase (in  $Z$ ) are  $\underline{U} = 10 \sqrt{2} \cos(\omega t + 45^\circ) \text{ V}$  and  $\underline{I} = 5 \sqrt{2} \cos(\omega t + 135^\circ) \text{ A}$ .

Solution  
.. Calculation of physical values of the components.  
Solution  $R = 10 \sqrt{2} \cos(\omega t + 45^\circ) \text{ V}$  and  $X_L = 10 \sqrt{2} \cos(\omega t + 135^\circ) \text{ A}$

Solution  
 $\underline{I} = \frac{\underline{U}}{\underline{Z}} \iff \underline{U} = \underline{I} \cdot \underline{Z}$   
The current and voltage across the inductor  $\underline{U}_L = j \omega L \underline{I}$  and  $\underline{U}_R = R \underline{I}$  are real resulting in  $\underline{U}_L = j 4.68 \underline{I}$  and  $\underline{U}_R = 0.24 \underline{I}$ .  
The voltage across the capacitor is  $\underline{U}_C = \frac{1}{j \omega C} \underline{I} = -j 4.68 \underline{I}$ .  
The total voltage  $\underline{U} = \underline{U}_L + \underline{U}_R + \underline{U}_C = j 4.68 \underline{I} + 0.24 \underline{I} - j 4.68 \underline{I} = 0.24 \underline{I}$ .  
With the complex part comes  $\underline{U} = 0.24 \underline{I}$  and  $\underline{I} = \frac{\underline{U}}{0.24}$ .  
The phase  $\varphi$  can be calculated as  $\varphi = \arctan\left(\frac{\text{Im}(\underline{U})}{\text{Re}(\underline{U})}\right) = \arctan\left(\frac{-4.68}{0.24}\right) = -10.8^\circ$ .
