Exercise E1 Resistivity and temperature dependent Resistance (written test, approx. 7 % of a 60-minute written test, SS2023) 2

resistivity, power, exam ee1 SS2023

**Exercise E1 Resistivity and temperature dependent Resistance
(written test, approx. 7 % of a 60-minute written test, SS2023)**

The conductivity of a dielectric material is given by the Arrhenius law, which is described by the equation $\rho(T) = \rho_0 \exp(-E_a/kT)$. The activation energy E_a is 0.8 eV. The resistivity of the material is $10^{17} \Omega \cdot m$ at $20^\circ C$. Calculate the resistivity at $55^\circ C$.

Solution
The resistivity of the dielectric material is $\rho_{PP}(20^\circ C) = 10^{17} \Omega \cdot m$.

For the given material the temperature coefficients in the range of $20^\circ C$ and $55^\circ C$ are given as $\alpha = -0.048 \text{ 1/K}$ and $\beta = +0.00057 \text{ 1/K}^2$.

$$\begin{aligned} R(55^\circ C) &= R(20^\circ C) \cdot (1 + \alpha \cdot \Delta T + \beta \cdot T^2 + \dots) \\ &= 80 \text{ G}\Omega \cdot (1 - 0.048 \text{ 1/K} \cdot (35 \text{ K}) + 0.00057 \text{ 1/K}^2 \cdot \Delta T^2) \end{aligned}$$

Calculate the resistance for the dielectric material for $20^\circ C$.

Solution

$$\begin{aligned} R(20 \text{ }^\circ\text{C}) &= \rho \cdot \frac{d}{A} \\ &= 10^{17} \text{ } \Omega \cdot \frac{0.8 \cdot 10^{-6} \text{ m}}{1 \text{ m}^2} \end{aligned}$$
