Exercise E1.1 Impedances at different Frequencies
(written test, approx. 18 % of a 60-minute written test, WS2022)

A series circuit consists of a resistor $R_1 = 1.00 \text{ } \Omega$, an inductor $L = 4.7 \text{ } \mu\text{H}$, and a capacitor $C = 40 \text{ nF}$. The circuit is connected to an AC voltage source $U = 60 \text{ V}$ at a frequency $f = 450 \text{ kHz}$. The current I through the circuit is $I = 10.0 \text{ mA}$. The resistor R_1 shall have the same absolute value of the impedance as a capacitor $C_1 = 40 \text{ nF}$ at $f_1 = 4 \text{ MHz}$.

Solution

$R_1 = 1.00 \text{ } \Omega$

$R_2 = 10.0 \text{ } \Omega$

A series circuit means that the current is constant on every component.

The equivalent impedance for R and L combined is given by

Parallel circuit means that the voltage is the same on R_2 and C_1

Since R_2 and C_1 are in parallel, the voltage across them is the same. The current through R_2 is $I_{R2} = I \cdot \frac{R_2}{R_2 + X_{C1}}$ and the current through C_1 is $I_{C1} = I \cdot \frac{X_{C1}}{R_2 + X_{C1}}$. The total current I is the sum of I_{R2} and I_{C1} .

Therefore, the resulting current of the parallel circuit is given as:

$I = I_{R2} + I_{C1} = I \cdot \left(\frac{R_2}{R_2 + X_{C1}} + \frac{X_{C1}}{R_2 + X_{C1}} \right) = I \cdot \frac{R_2 + X_{C1}}{R_2 + X_{C1}} = I$

Back to the first formula:

$R_3 \cdot I = X_{C3} \cdot I \cdot \frac{R_3}{R_3 + X_{C3}}$
