**Exercise E1 Equivalent linear Source  
(written test, approx. 14 % of a 60-minute written test, WS2022)**

The circuit in the following has to be simplified.  
Result

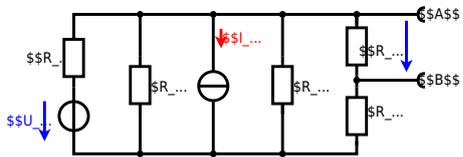

$$\begin{aligned} U_{\text{rs}} &= U_{\text{AB}} = 4.5 \text{ V} \\ R_{\text{i}} &= R_{\text{AB}} = 6 \text{ } \Omega \end{aligned}$$

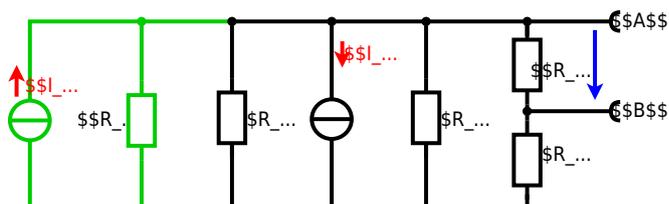

Calculated the internal resistance  $R_{\text{i}}$  and the source voltage  $U_{\text{rs}}$  of an equivalent linear voltage source on the connectors  $\text{A}$  and  $\text{B}$ . 
$$R_1=5.0 \text{ } \Omega, \quad U_2=6.0 \text{ V}, \quad R_3= 10 \text{ } \Omega, \quad I_4=4.2 \text{ A}, \quad R_5=10 \text{ } \Omega, \quad R_6=7.5 \text{ } \Omega, \quad R_7=15 \text{ } \Omega$$
 Use equivalent sources in order to simplify the circuit!

Solution

The best thing is to re-think the wiring like rubber bands and adjust them:

The linear voltage source of  $U_2$  and  $R_1$  can be transformed into a current source  $I_2 = \frac{U_2}{R_1}$  and  $R_1$ :

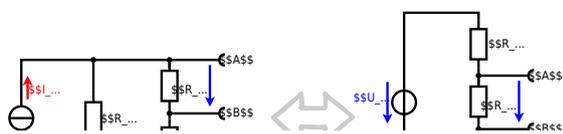

Now a lot of them can be combined. The resistors  $R_1$ ,  $R_3$ ,  $R_5$  are in parallel, like also  $I_2$  and  $I_4$ :

$$R_{135} = R_1 || R_3 || R_5$$

$$I_{24} = I_2 - I_4 = \frac{U_2}{R_1} - I_4$$

The resulting circuit can again be transformed:

Here, the  $U_{24}$  is calculated by  $I_{24}$  as the following:

$$U_{24} = I_{24} \cdot R_{67}$$

$$U_{AB} = U_{24} \cdot \frac{R_7}{R_6 + R_7 + R_1 || R_3 || R_5} - I_4 \cdot R_1 || R_3 || R_5$$

On the right side of the last circuit, there is a voltage divider given by  $R_{135}$ ,  $R_6$ , and  $R_7$ .

Therefore the voltage between  $A$  and  $B$  is given as:

$$U_{AB} = U_{24} \cdot \frac{R_7}{R_6 + R_7 + R_1 || R_3 || R_5} - (U_2 \over R_1 - I_4) \cdot \frac{R_7 \cdot R_1 || R_3 || R_5}{R_6 + R_7 + R_1 || R_3 || R_5}$$

For the internal resistance  $R_i$  the ideal voltage source is substituted by its resistance ( $=0 \Omega$ , so a short-circuit):

$$R_{AB} = R_7 || (R_6 + R_1 || R_3 || R_5)$$

with  $R_1 || R_3 || R_5 = 5 \Omega || 10 \Omega || 10 \Omega = 5 \Omega || 5 \Omega = 2.5 \Omega$ :

$$U_{AB} = \frac{6.0 \text{ V}}{5.0 \Omega} - 4.2 \Omega \cdot \frac{15 \Omega \cdot 2.5 \Omega}{7.5 \Omega + 15 \Omega + 2.5 \Omega}$$

$$R_{AB} = 15 \Omega || (7.5 \Omega + 2.5 \Omega)$$

'~~#@ee1\_taskctr.#~~'

**Exercise E1 Temperature-dependent Resistance**  
**(written test, approx. 6 % of a 60-minute written test, WS2022)**

2. The graph shows the temperature dependence of the resistance of a resistor. The resistor has a resistance of  $10 \text{ k}\Omega$  at  $25^\circ\text{C}$ . Calculate the resistance of the thermistor at  $-40^\circ\text{C}$ .

Its temperature coefficients are:  $\alpha = 0.01 \frac{1}{\text{K}}$  and  $\beta = 71 \cdot 10^{-6} \frac{1}{\text{K}^2}$ .

The temperature inside the refrigeration system can reach down to  $-40^\circ\text{C}$ .

$$R = 10 \text{ k}\Omega \cdot (1 + \alpha \cdot \Delta T + \beta \cdot \Delta T^2)$$

Resistor transfer resistor  $R$  and  $U$  are constant. Therefore, a solution is to increase the heat flow up the refrigeration system.

Therefore, with constant  $U$  and increasing  $R$  the power decreases. Ten times more resistance decreases the heat flow to one-tenth.

$$R = R_0 \cdot (1 + \alpha \cdot \Delta T + \beta \cdot \Delta T^2)$$

with  $\Delta T = T_{\text{end}} - T_{\text{start}}$

$$R = 10 \text{ k}\Omega \cdot \left( 1 + 0.01 \frac{1}{\text{K}} \cdot (-40^\circ\text{C} - 25^\circ\text{C}) + 71 \cdot 10^{-6} \frac{1}{\text{K}^2} \cdot (-40^\circ\text{C} - 25^\circ\text{C})^2 \right)$$

'~~#@ee1\_taskctr.#~~'

### Exercise E2 Analyzing complex Impedances (written test, approx. 14 % of a 60-minute written test, WS2022)

2. Calculate the phasor voltage  $\underline{U}$  and the phasor current  $\underline{I}$  in the circuit shown in the figure. The components  $R$  and  $X_L$  shall be given.

After analysis, the following phasors shall be determined:  $\underline{U}$  and  $\underline{I}$  in the circuit. The phasors shall be given in the form  $\underline{U} = U \cdot e^{j(\omega t + \varphi)}$  and  $\underline{I} = I \cdot e^{j(\omega t + \varphi)}$ .

.. Calculate the physical values of the voltage and current. Solution:  $\underline{U} = 10 \sqrt{2} \cdot e^{j(0.2\pi t - 2.6)} \text{ V}$  and  $\underline{I} = 1.06 \cdot e^{j(0.2\pi t - 2.6)} \text{ A}$

Solution: 
$$\underline{I} = \frac{\underline{U}}{\underline{Z}} = \frac{50 \angle 0^\circ}{4.68 \angle -20^\circ} = 10.68 \angle 20^\circ \text{ A}$$
 The current and voltage are in phase since the circuit is purely resistive. The voltage across the resistor is  $\underline{U}_R = \underline{I} \cdot R = 10.68 \cdot 4.68 \angle 20^\circ = 49.8 \angle 20^\circ \text{ V}$ . The voltage across the inductor is  $\underline{U}_L = \underline{I} \cdot jX_L = 10.68 \cdot j30 = 320.4 \angle 110^\circ \text{ V}$ . The phasor voltage  $\underline{U}$  is the vector sum of  $\underline{U}_R$  and  $\underline{U}_L$ . 
$$\underline{U} = \underline{U}_R + \underline{U}_L = 49.8 \angle 20^\circ + 320.4 \angle 110^\circ = 10 \sqrt{2} \angle 0^\circ \text{ V}$$
 With the complex part comes the magnitude value  $U = 10 \sqrt{2} \text{ V}$ . The phase  $\varphi$  can be calculated as  $\varphi = \arctan\left(\frac{\text{Im}(\underline{U})}{\text{Re}(\underline{U})}\right) = \arctan\left(\frac{-4.68}{0.24}\right) = -2.6 \text{ rad}$

'~~#@ee1\_taskctr.#~~'

### Exercise E1 Complex Impedance Circuit (written test, approx. 15 % of a 60-minute written test, WS2022)

2. Calculate the resulting phasor voltage  $\underline{U}$  and the phasor current  $\underline{I}$  in the circuit shown in the figure. The voltage source  $u(t) = 3.0 \cdot \sin(2\pi \cdot 15 \cdot t) \text{ V}$  is a sinusoidal source with a frequency of  $f = 15 \text{ Hz}$ .

This linear source is connected with an inductor of  $L = 330 \mu\text{H}$  and a capacitor of  $C = 22 \mu\text{F}$ , all in series.

.. Draw the circuit diagram of the given circuit. Label all components, voltages, and currents. Solution:  $\underline{Z} = 19.8 \angle -0.6 \text{ } \Omega$  and  $\underline{U} = 48.2 \angle -0.6 \text{ V}$

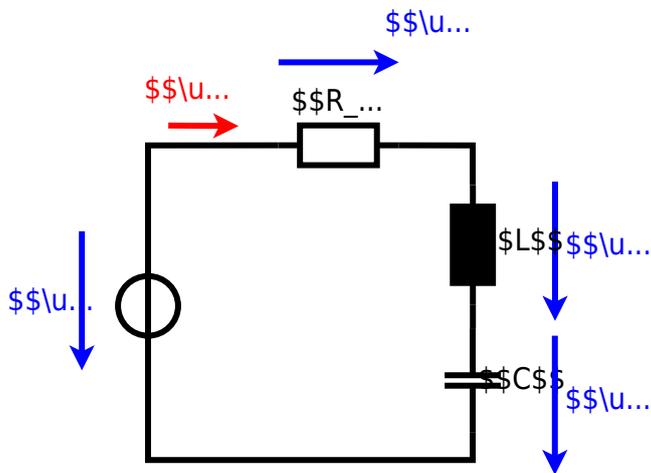

```

\begin{align*} Z &= \frac{\hat{U}}{\hat{I}} \quad \hat{I} = \frac{\hat{U}}{Z} \\
\end{align*}
\begin{align*} Z_C &= \frac{1}{2\pi f C} \quad \omega = 2\pi \cdot 15 \\
\text{Winkel } \varphi &= \arctan\left(\frac{X_L}{X_C}\right) = \arctan\left(\frac{30}{19.28}\right) \\
\end{align*}
\begin{align*} Z_C &= \frac{1}{2\pi \cdot 15 \cdot 330 \cdot 10^{-6}} \\
\end{align*}
\underline{Z} = R + j \underline{Z}_L - j \underline{Z}_C \quad \underline{Z} = R + j(\underline{Z}_L - \underline{Z}_C) \\
|\underline{Z}| = \sqrt{R^2 + (\underline{Z}_L - \underline{Z}_C)^2}

```

### Exercise E3 Impedances at different Frequencies (written test, approx. 18 % of a 60-minute written test, WS2022)

A series circuit means that the current is constant on every component.  
 The equivalent impedance for  $R$  and  $L$  combined is given by  $Z = \sqrt{R^2 + X_L^2}$   
 Parallel circuit means that the voltage is the same on  $R_2$  and  $C_1$   
 Since  $X_C = \frac{1}{\omega C}$  and  $X_L = \omega L$ , we have  $X_C = \frac{1}{2\pi \cdot 40 \cdot 10^{-9}} = 398 \Omega$   
 $X_L = 2\pi \cdot 4 \cdot 10^6 \cdot 4.7 \cdot 10^{-6} = 118 \Omega$   
 Therefore the resulting current of the parallel circuit is given as:  
 $I_{3C} = \frac{U}{Z_{3C}} = \frac{10}{\sqrt{398^2 + 118^2}} = 25.5 \text{ mA}$   
 Back to the first formula:  $R_3 \cdot I_{3R} = X_{3C} \cdot I_{3C}$   
 $R_3 = \frac{X_{3C} \cdot I_{3C}}{I_{3R}} = \frac{398 \cdot 25.5}{100} = 100 \Omega$

Solution

$R_1 = 100 \Omega$   
 $R_2 = 10 \Omega$

A series circuit means that the current is constant on every component.  
 The equivalent impedance for  $R$  and  $L$  combined is given by  $Z = \sqrt{R^2 + X_L^2}$   
 Parallel circuit means that the voltage is the same on  $R_2$  and  $C_1$   
 Since  $X_C = \frac{1}{\omega C}$  and  $X_L = \omega L$ , we have  $X_C = \frac{1}{2\pi \cdot 40 \cdot 10^{-9}} = 398 \Omega$   
 $X_L = 2\pi \cdot 4 \cdot 10^6 \cdot 4.7 \cdot 10^{-6} = 118 \Omega$   
 Therefore the resulting current of the parallel circuit is given as:  
 $I_{3C} = \frac{U}{Z_{3C}} = \frac{10}{\sqrt{398^2 + 118^2}} = 25.5 \text{ mA}$   
 Back to the first formula:  $R_3 \cdot I_{3R} = X_{3C} \cdot I_{3C}$   
 $R_3 = \frac{X_{3C} \cdot I_{3C}}{I_{3R}} = \frac{398 \cdot 25.5}{100} = 100 \Omega$

'~~#@ee1\_taskctr.#~~'

### Exercise E4 Resistance of a Wire by Resistivity (written test, approx. 6 % of a 60-minute written test, WS2022)

The heating element is used to heat the wire with a temperature of  $1800 \text{ K}$ .  
 Result: power dissipation ( $=$  heat flow) of  $P=40 \text{ W}$  is necessary.  
 Calculate the current  $I$  needed to operate it.  
 The Nichrome wire has a resistivity of  $1.10 \cdot 10^{-6} \Omega \cdot \text{m}$ .  
 The heating element is  $3 \text{ m}$  long and has a diameter of  $3.57 \text{ mm}$ .  
 Calculate the resistance  $R$  of the heating element.

Solution

$$\begin{aligned} P &= U \cdot I = R \cdot I^2 \quad \rightarrow \quad I = \sqrt{\frac{P}{R}} = \sqrt{\frac{40 \text{ W}}{0.33 \text{ } \Omega}} \end{aligned}$$

$$\begin{aligned} R &= \rho \cdot \frac{l}{A} \quad | \quad A = r^2 \cdot \pi = \frac{1}{4} d^2 \cdot \pi \quad R = \rho \cdot \frac{4 \cdot l}{d^2 \cdot \pi} \quad R = 1.10 \cdot 10^{-6} \text{ } \Omega \cdot \frac{4 \cdot 3 \text{ m}}{(3.57 \cdot 10^{-3} \text{ m})^2 \cdot \pi} \end{aligned}$$

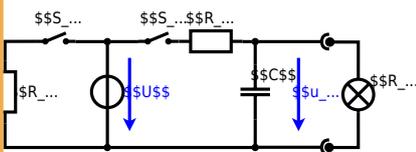

'~~#@ee1\_taskctr.#~~'

**Exercise E5 Charging Capacitors**  
(written test, approx. 16 % of a 60-minute written test, WS2022)

The circuit (with the real battery) also takes into account the internal resistance  $R_1$  of the battery. The capacitor is initially uncharged. The switch  $S_1$  is closed at  $t_0 = 0 \text{ s}$ . The voltage across the capacitor is again  $U_c$  at the moment  $t_0 = 0 \text{ s}$  when the switch  $S_1$  is closed. Calculate the voltage  $u_c(t_2)$  across the capacitor at  $t_2 = 1 \text{ ms}$  after closing the switch.

**Solution**  
Hint: To solve this, first create an equivalent linear voltage source from  $U$ ,  $R_1$ , and  $R_2$ .

**Solution**  
The ideal voltage source  $U$  is in series with the internal resistance  $R_1$  and the external resistor  $R_2$ . The voltage across the capacitor is  $u_c(t) = U \cdot (1 - e^{-t/\tau})$ , where  $\tau = (R_1 + R_2) \cdot C$ .  
On an alternative view, one can try to create an equivalent linear voltage source again. Then, the internal resistance is given by substituting the ideal voltage source is again short-circuiting  $R_2$ .

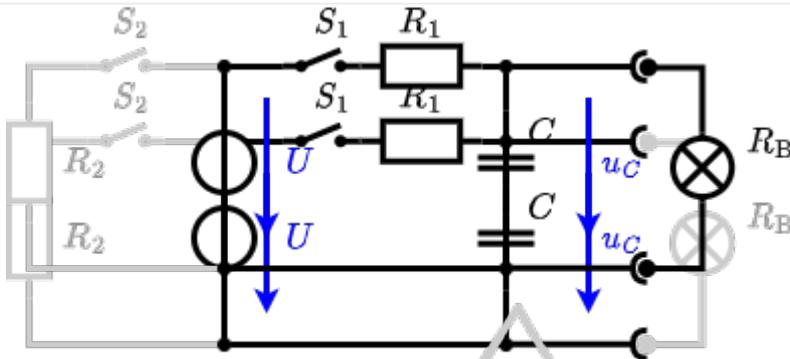

The circuit contains a voltage source  $U = 12 \text{ V}$ , a switch  $S_1$ , a resistor of  $R_1 = 20 \text{ } \Omega$  and a capacitor of  $C = 100 \text{ } \mu\text{F}$ .

The switch  $S_2$  to an additional consumer  $R_2$  will be considered to be open for the first asks. At the moment  $t_0 = 0 \text{ s}$  the switch  $S_1$  is closed, the voltage across the capacitor is  $u_c(t_0) = 0 \text{ V}$ .

- 1. First do not consider the light bulb - it is not connected to the RC circuit.
- 2. Calculate the point of time  $t_1$  when  $u_c(t_1) = 0.5 \cdot U$ .

Solution

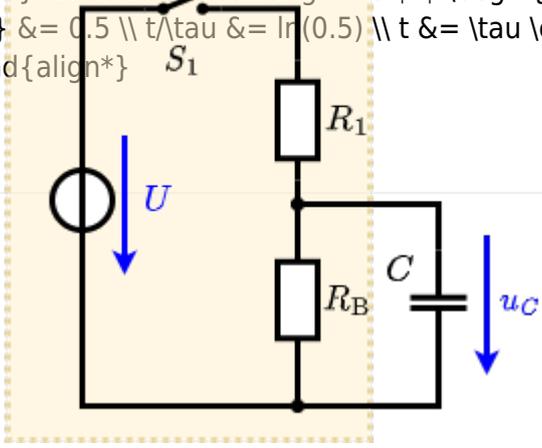

So, here only  $R_1$  and  $C$  gives the time constant:  $\tau = R_1 \cdot C$

The following formula describes the time course of  $u_C(t)$  which has to be  $u_C(t_1) = 0.5 \cdot U$ :  

$$u_C(t) = U \cdot (1 - e^{-t/\tau}) = 0.5 \cdot U$$
 It has to be rearranged to  $(1 - e^{-t/\tau}) = 0.5$   

$$e^{-t/\tau} = 0.5 \implies -t/\tau = \ln(0.5) \implies t = \tau \cdot \ln(0.5)$$

An equivalent linear voltage source can be given with  $U_s$ ,  $R_1$ , and  $R_B$  as seen in yellow.

Therefore, the voltage of the equivalent linear voltage source is:  $U_s = U \cdot \frac{R_B}{R_1 + R_B} = \frac{1}{2} \cdot U$   
 The internal resistance is given by substituting the ideal voltage source with its resistance ( $R_i = 0 \Omega$ , short-circuit).  
 $R_i = R_1 \parallel R_B = 10 \Omega$

$$u_C(t_2) = U_s \cdot (1 - e^{-t_2/(R_i \cdot C)}) = \frac{1}{2} \cdot U \cdot (1 - e^{-1 \text{ms} / (10 \Omega \cdot 100 \mu\text{F})})$$

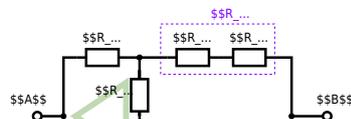

'~~#@ee1\_taskctr.#~~'

**Exercise E6 Pure Resistor Network Simplification**  
 (written test, approx. 13 % of a 60-minute written test, WS2022)

The following shall be solved at 0°C.  $R_1 = R_2 = R_3 = 10 \Omega$ ,  $C = 1 \mu\text{F}$  and the switch is closed.  $U = 10 \text{V}$ .

Solution

$R_2 = R_3 = 100 \Omega$

Since  $R_2 = R_3$  and based on the equations for the transformation, the transformed  $R_Y$  is given as:

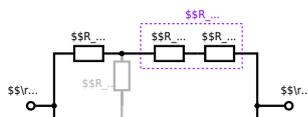

$$R_Y = \frac{R_2 \cdot R_2}{R_2 + R_2} = \frac{(100 \Omega)^2}{3 \cdot 100 \Omega} = \frac{1}{3} \cdot 100 \Omega = 33.33 \Omega$$

The equivalent resistor is given by a parallel configuration of resistors in series:

$$R_{\text{eq}} = R_Y + (R_Y + R_1) \parallel (R_Y + R_2) \parallel R_{\text{eq}} = 33.33 \Omega + (33.33 \Omega + 400 \Omega) \parallel (33.33 \Omega + 100 \Omega)$$

1. The switch shall now be open. Calculate the equivalent resistance  $R_{\text{eq}}$  between  $A$  and  $B$ .

Solution

The equivalent resistor is given by a parallel configuration of resistors in series:

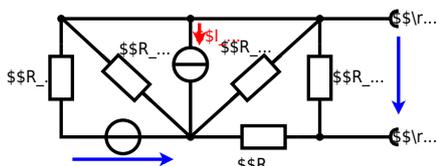

$$R_{\text{eq}} = (R_2 + R_1 + R_1) \parallel (R_2 + R_2) \parallel R_{\text{eq}} = (100 \Omega + 200 \Omega + 200 \Omega) \parallel (100 \Omega + 100 \Omega) \parallel R_{\text{eq}} = (500 \Omega) \parallel (200 \Omega) \parallel R_{\text{eq}} = \frac{500 \Omega \cdot 200 \Omega}{500 \Omega + 200 \Omega} \parallel$$

'~~#@ee1\_taskctr.#~~'

**Exercise E3 Equivalent linear Source  
(written test, approx. 14 % of a 60-minute written test, WS2022)**

The circuit in the following has to be simplified.  
Result

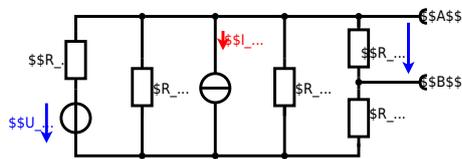

$$U_{\text{s}} = U_{\text{AB}} = 4.5 \text{ V} \quad R_{\text{i}} = R_{\text{AB}} = 6 \Omega$$

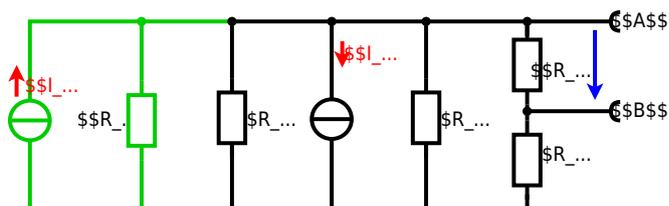

Calculate the internal resistance  $R_i$  and the source voltage  $U_s$  of an equivalent linear voltage source on the connectors A and B.  $R_1=5.0 \Omega$ ,  $U_2=6.0 \text{ V}$ ,  $R_3=10 \Omega$ ,  $I_4=4.2 \text{ A}$ ,  $R_5=10 \Omega$ ,  $R_6=7.5 \Omega$ ,  $R_7=15 \Omega$ . Use equivalent sources in order to simplify the circuit!

### Solution

The best thing is to re-think the wiring like rubber bands and adjust them:

The linear voltage source of  $U_2$  and  $R_1$  can be transformed into a current source  $I_2 = \frac{U_2}{R_1}$  and  $R_1$ :

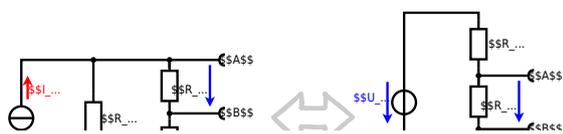

Now a lot of them can be combined. The resistors  $R_1$ ,  $R_3$ ,  $R_5$  are in parallel, like also  $I_2$  and  $I_4$ :

$$R_{135} = R_1 || R_3 || R_5$$

$$I_{24} = I_2 - I_4$$

The resulting circuit can again be transformed:

Here, the  $U_{24}$  is calculated by  $I_{24}$  as the following:

$$U_{24} = I_{24} \cdot R_{135} + I_{24} \cdot R_4 + I_{24} \cdot R_5 + I_{24} \cdot R_6$$

$$U_{AB} = U_{24} \cdot \left( \frac{R_7}{R_6 + R_7 + R_1 || R_3 || R_5} \right) - I_4 \cdot R_1 || R_3 || R_5$$

On the right side of the last circuit, there is a voltage divider given by  $R_{135}$ ,  $R_6$ , and  $R_7$ .

Therefore the voltage between  $A$  and  $B$  is given as:

$$U_{AB} = U_{24} \cdot \left( \frac{R_7}{R_6 + R_7 + R_1 || R_3 || R_5} \right) - \left( \frac{U_2}{R_1} - I_4 \right) \cdot \left( R_1 || R_3 || R_5 \right)$$

For the internal resistance  $R_i$  the ideal voltage source is substituted by its resistance ( $=0 \Omega$ , so a short-circuit):

$$R_{AB} = R_7 || (R_6 + R_1 || R_3 || R_5)$$

with  $R_1 || R_3 || R_5 = 5 \Omega || 10 \Omega || 10 \Omega = 5 \Omega || 5 \Omega = 2.5 \Omega$ :

$$U_{AB} = \left( \frac{6.0 \text{ V}}{5.0 \Omega} - 4.2 \text{ A} \right) \cdot \left( \frac{15 \Omega \cdot 2.5 \Omega}{7.5 \Omega + 15 \Omega + 2.5 \Omega} \right)$$

$$R_{AB} = 15 \Omega || (7.5 \Omega + 2.5 \Omega)$$

'~~#@ee1\_taskctr.#~~'

**Exercise E2 Temperature-dependent Resistance**  
**(written test, approx. 6 % of a 60-minute written test, WS2022)**

2. The diagram shows a temperature-dependent resistor in a circuit. The resistor has a resistance of  $10 \text{ k}\Omega$  at  $25^\circ\text{C}$  and a temperature coefficient of  $\alpha = 0.01 \text{ K}^{-1}$  and  $\beta = 71 \cdot 10^{-6} \text{ K}^{-2}$ . Calculate the resistance of the thermistor at  $-40^\circ\text{C}$ .

Result:  $R = 6.5 \text{ k}\Omega$

The temperature inside the refrigeration system can reach down to  $-40^\circ\text{C}$ .

$$R = 10 \text{ k}\Omega \cdot \left( 1 + \alpha \cdot \Delta T + \beta \cdot \Delta T^2 \right)$$

Resistance of the resistor  $R$  depends on the temperature  $T$  and the heat flow  $\dot{Q}$ . Therefore, a solution is to use a heat exchanger to pre-heat the refrigeration system.

Therefore, with constant  $U$  and increasing  $R$  the power decreases. Ten times more resistance decreases the heat flow to one-tenth.

$$R = R_0 \cdot \left( 1 + \alpha \cdot \Delta T + \beta \cdot \Delta T^2 \right)$$

with  $\Delta T = T_{\text{end}} - T_{\text{start}}$

$$R = 10 \text{ k}\Omega \cdot \left( 1 + 0.01 \text{ K}^{-1} \cdot (-40^\circ\text{C} - 25^\circ\text{C}) + 71 \cdot 10^{-6} \text{ K}^{-2} \cdot (-40^\circ\text{C} - 25^\circ\text{C})^2 \right)$$

'~~#@ee1\_taskctr.#~~'

### Exercise E5 Analyzing complex Impedances (written test, approx. 14 % of a 60-minute written test, WS2022)

2. Calculate the phasor voltage  $\underline{u}$  (in V) at  $t = 30$  ms for the circuit shown in the figure. The current  $i$  and the voltage  $\underline{u}$  shall be given.

After analysis, the following phasor voltage  $\underline{u}$  is extracted:  $\underline{u} = 48.2 \angle -19.8^\circ$  V. In the time domain, the voltage is  $u(t) = 48.2 \sqrt{2} \cos(2\pi \cdot 15 \cdot t - 19.8^\circ)$  V.

Solution  
.. Calculate the physical values of the components.  
Solution  $R = 10 \Omega$ ,  $L = 30 \mu\text{H}$ ,  $C = 100 \text{ nF}$

Solution  
$$\underline{I} = \frac{\underline{U}}{\underline{Z}} = \frac{50 \angle 0^\circ}{10 + j\omega L - j\omega C} = \frac{50 \angle 0^\circ}{10 + j(30 \cdot 10^{-6})\omega - j\omega(100 \cdot 10^{-9})}$$
  
The current and voltage are in phase since the circuit is purely resistive.  
The magnitude of the current is  $I = \frac{50}{10} = 5$  A.  
The phase of the current is  $\varphi = \arctan\left(\frac{-4.68}{0.24}\right) = -10.9^\circ$ .  
The voltage  $\underline{u}$  is  $\underline{u} = \underline{I} \cdot \underline{Z} = 5 \angle -10.9^\circ \cdot (10 + j0.3 - j0.3) = 50 \angle -10.9^\circ$  V.  
With the complex part comes the complex value  $\underline{u} = 50 \angle -10.9^\circ$  V.  
The phase  $\varphi$  can be calculated as  $\varphi = \arctan\left(\frac{\text{Im}(\underline{Z})}{\text{Re}(\underline{Z})}\right) = \arctan\left(\frac{-4.68}{0.24}\right)$

### Exercise E7 Complex Impedance Circuit (written test, approx. 15 % of a 60-minute written test, WS2022)

2. Calculate the resulting phasor voltage  $\underline{u}$  (in V) at  $t = 30$  ms for the circuit shown in the figure. The current  $i$  and the voltage  $\underline{u}$  shall be given.  
The voltage source is  $u(t) = 3.0 \cos(2\pi \cdot 15 \cdot t)$  V.  
The circuit consists of a resistor of  $10 \Omega$ , an inductor of  $30 \mu\text{H}$ , and a capacitor of  $100 \text{ nF}$ , all in series.

Solution  
Result  
.. Draw the circuit diagram of the given circuit.  
Label all components, voltages, and currents.

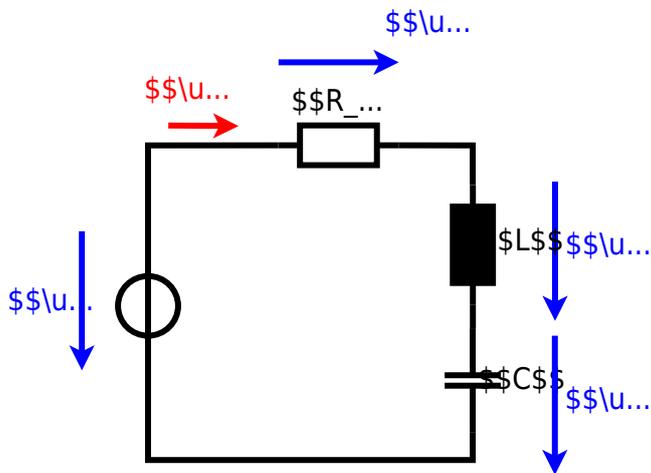

```

\begin{align*} Z &= \frac{\hat{U}}{\hat{I}} \quad \hat{I} = \frac{\hat{U}}{Z} \\
\end{align*}
\begin{align*} Z_C &= \frac{1}{2\pi \cdot f \cdot C} \quad \omega = 2\pi \cdot 15 \\
\text{Winkel } \varphi &= \arctan\left(\frac{X_L}{X_C}\right) = \arctan\left(\frac{30 \cdot 10^{-3} \cdot \omega}{\frac{1}{2\pi \cdot 15 \cdot 10^{-6}}}\right) \\
\end{align*}
\begin{align*} Z &= \sqrt{R^2 + (X_L - X_C)^2} \\
\end{align*}
\begin{align*} Z_C &= \frac{1}{2\pi \cdot f \cdot C} \quad \omega = 2\pi \cdot 15 \\
&\sim 30 \text{ kHz} \cdot 330 \text{ } \mu\text{H} \\
\end{align*}
\begin{align*} \underline{Z} &= R + j \cdot \underline{Z}_L - j \cdot \underline{Z}_C \\
&= R + j \cdot (\underline{Z}_L - \underline{Z}_C) \\
|\underline{Z}| &= \sqrt{R^2 + (\underline{Z}_L - \underline{Z}_C)^2} \\
\end{align*}

### Exercise E6 Impedances at different Frequencies (written test, approx. 18 % of a 60-minute written test, WS2022)

A series circuit means that the current is constant on every component.  
 The equivalent impedance for  $R$  and  $L$  combined is given by  $Z = R + j\omega L$ .  
 A parallel circuit means that the voltage is the same on  $R$  and  $C$ .  
 The equivalent impedance for  $R$  and  $C$  combined is given by  $Z = \frac{R \cdot j\omega C}{1 + \omega^2 R^2 C^2}$ .  
 The resulting current of the parallel circuit is given as:  $I = \frac{U}{Z}$ .  
 Back to the first formula:  $R \cdot I = X \cdot I \cdot \frac{I}{I} = X \cdot I \cdot \frac{I}{I} = X \cdot I \cdot \frac{I}{I}$

Solution

$R_1 = 1.00 \cdot \omega$

$R_2 = 10.0 \cdot \omega$

A series circuit means that the current is constant on every component.  
 The equivalent impedance for  $R$  and  $L$  combined is given by  $Z = R + j\omega L$ .  
 A parallel circuit means that the voltage is the same on  $R$  and  $C$ .  
 The equivalent impedance for  $R$  and  $C$  combined is given by  $Z = \frac{R \cdot j\omega C}{1 + \omega^2 R^2 C^2}$ .  
 The resulting current of the parallel circuit is given as:  $I = \frac{U}{Z}$ .  
 Back to the first formula:  $R \cdot I = X \cdot I \cdot \frac{I}{I} = X \cdot I \cdot \frac{I}{I} = X \cdot I \cdot \frac{I}{I}$

### Exercise E1 Resistance of a Wire by Resistivity (written test, approx. 6 % of a 60-minute written test, WS2022)

The heating element is used to heat the wire with a temperature of  $1800 \text{ K}$ .  
 The power dissipation (= heat flow) of  $P = 40 \text{ W}$  is necessary.  
 Calculate the current  $I$  needed to operate it.  
 The Nichrome wire has a resistivity of  $1.10 \cdot 10^{-6} \cdot \omega \text{ m}$ .

The heating element is  $3 \text{ m}$  long and has a diameter of  $3.57 \text{ mm}$ .  
 Calculate the resistance  $R$  of the heating element.

Solution

$$\begin{aligned} P &= U \cdot I = R \cdot I^2 \quad \rightarrow \quad I = \sqrt{\frac{P}{R}} = \sqrt{\frac{40 \text{ W}}{0.33 \text{ } \Omega}} \end{aligned}$$

$$\begin{aligned} R &= \rho \cdot \frac{l}{A} \quad | \quad A = r^2 \cdot \pi \\ \frac{1}{4} d^2 \cdot \pi \quad | \quad R &= \rho \cdot \frac{l}{d^2 \cdot \pi} \quad | \quad R = 1.10 \cdot 10^{-6} \text{ } \Omega \cdot \frac{4 \cdot 3 \text{ m}}{(3.57 \cdot 10^{-3} \text{ m})^2 \cdot \pi} \end{aligned}$$

**Exercise E4 Charging Capacitors**  
(written test, approx. 16 % of a 60-minute written test, WS2022)

The circuit (with the real battery) also takes into account the internal resistance  $R_1$  of the battery. The capacitor  $C$  is initially uncharged. The switch  $S_1$  is open. The voltage across the capacitor is again  $0 \text{ V}$  at the moment  $t_0 = 0 \text{ s}$  when the switch  $S_1$  is closed. Calculate the voltage  $u_c(t_2)$  across the capacitor at  $t_2 = 1 \text{ ms}$  after closing the switch.

**Solution**  
Hint: To solve this, first create an equivalent linear voltage source from  $U$ ,  $R_1$ , and  $R_2$ .

**Solution**  
The ideal voltage source  $U$  is in series with the internal resistance  $R_1$  and the external resistor  $R_2$ . The voltage across the capacitor is  $u_c(t) = U \cdot (1 - e^{-t/\tau})$ , where  $\tau = (R_1 + R_2) \cdot C$ .  
On an alternative view, one can try to create an equivalent linear voltage source again. Then, the internal resistance is given by substituting the ideal voltage source is again short-circuiting  $R_2$ .

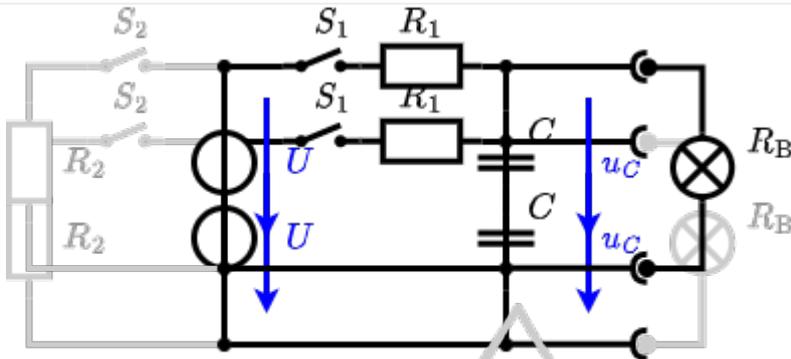

The circuit contains a voltage source  $U = 12 \text{ V}$ , a switch  $S_1$ , a resistor of  $R_1 = 20 \text{ } \Omega$  and a capacitor of  $C = 100 \text{ } \mu\text{F}$ .

The switch  $S_2$  to an additional consumer  $R_2$  will be considered to be open for the first asks. At the moment  $t_0 = 0 \text{ s}$  the switch  $S_1$  is closed, the voltage across the capacitor is  $u_c(t_0) = 0 \text{ V}$ .

- .. First do not consider the light bulb - it is not connected to the RC circuit.
- Calculate the point of time  $t_1$  when  $u_c(t_1) = 0.5 \cdot U$ .

Solution

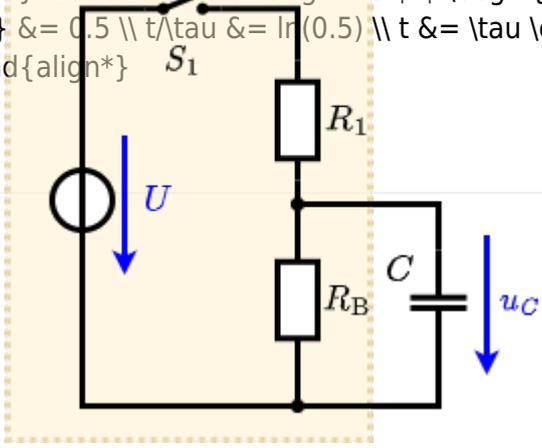

So, here only  $R_1$  and  $C$  gives the time constant:  $\tau = R_1 \cdot C$

The following formula describes the time course of  $u_C(t)$  which has to be  $u_C(t_1) = 0.5 \cdot U$ :  

$$u_C(t) = U \cdot (1 - e^{-t/\tau}) = 0.5 \cdot U$$
 It has to be rearranged to  $(1 - e^{-t/\tau}) = 0.5$   

$$e^{-t/\tau} = 0.5 \implies -t/\tau = \ln(0.5) \implies t = \tau \cdot \ln(0.5) = R_1 \cdot C \cdot \ln(0.5)$$

An equivalent linear voltage source can be given with  $U_s$ ,  $R_1$ , and  $R_B$  as seen in yellow.

Therefore, the voltage of the equivalent linear voltage source is:  $U_s = U \cdot \frac{R_B}{R_1 + R_B} = \frac{1}{2} \cdot U$   
 The internal resistance is given by substituting the ideal voltage source with its resistance ( $R_i = 0 \Omega$ , short-circuit).  
 $R_i = R_1 \parallel R_B = 10 \Omega$

$$u_C(t_2) = U_s \cdot (1 - e^{-t_2/(R_i \cdot C)}) = \frac{1}{2} \cdot U \cdot (1 - e^{-1 \text{ms} / (10 \Omega \cdot 100 \mu\text{F})})$$

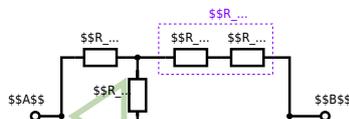

'~~#@ee1\_taskctr.#~~'

**Exercise E3 Pure Resistor Network Simplification**  
 (written test, approx. 13 % of a 60-minute written test, WS2022)

The following shall be solved at 0°C.  $R_1 = R_2 = R_3 = 10 \Omega$ ,  $C = 1 \mu\text{F}$  and the switch is closed.  $U = 200 \text{V}$ .  
 Result:  $i_B$ .

Solution

$R_{\text{eq}}$  (transfer function)  $\omega = 100 \text{ rad/s}$

Since  $R_2=R_3$  and based on the equations for the transformation, the transformed  $R_Y$  is given as:

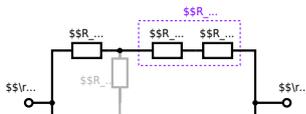

$$R_Y = \frac{R_2 \cdot R_2}{R_2 + R_2} = \frac{(100 \Omega)^2}{3 \cdot 100 \Omega} = \frac{1}{3} \cdot 100 \Omega = 33.33 \Omega$$

The equivalent resistor is given by a parallel configuration of resistors in series:

$$R_{\text{eq}} = R_Y + (R_Y + R_1) \parallel (R_Y + R_2) \parallel R_{\text{eq}} = 33.33 \Omega + (33.33 \Omega + 400 \Omega) \parallel (33.33 \Omega + 100 \Omega)$$

1. The switch shall now be open. Calculate the equivalent resistance  $R_{\text{eq}}$  between  $A$  and  $B$ .

Solution

The equivalent resistor is given by a parallel configuration of resistors in series:

$$R_{\text{eq}} = (R_2 + R_1 + R_1) \parallel (R_2 + R_2) \parallel R_{\text{eq}} = (100 \sim \Omega + 200 \sim \Omega + 200 \sim \Omega) \parallel (100 \sim \Omega + 100 \sim \Omega) \parallel R_{\text{eq}} = \{500 \sim \Omega \parallel (200 \sim \Omega) \parallel R_{\text{eq}} = \{500 \sim \Omega \cdot 200 \sim \Omega \} \over {500 \sim \Omega + 200 \sim \Omega} \}$$
